# WHO AM I?

**Assistant Professor** at **Politecnico di Milano** in Italy and  
**Visiting Researcher** at **Umeå University** in Sweden

I research new strategies to improve the efficiency of **data centers** and **clouds** by applying techniques derived from the **Artificial Intelligence** and **Machine Learning** fields.

I am very interested in **adaptation** and **self-adaptation** to discover how a complex system can heal itself when some problems occur.

# MY TOPICS

## GREEN IS

Energy-efficiency aware Information Systems. Detect undesired situations and select proper repair action using an adaptive decision system.

## IS MONITORING

Enable monitorability of applications. Discover hidden relations between monitoring data. Build prediction models. Apply techniques to reduce the volume of monitoring data.

## DaaS IN FOG

Move computation and/or data nearer to the users to improve Data Utility (QoS and Data Quality). Support the selection of the most suitable data source and manage data and computation movement for SLA satisfaction.

## BIG DATA QUALITY

Context-aware assessment of data quality for Big Data. Definition of new metrics and new techniques for assessing data quality with Big Data and limited time.

## PROCESSES IN IoT

Discover the relation between business process execution and data generated by IoT sensors. Improve the cooperation between business processes.

## SERVERLESS IN FOG

Improving energy efficiency and quality of service of serverless applications and FaaS scenarios in heterogeneous fog environments.

# CONTEXT

## Historical energy usage and projected energy usage under doubled computing demand

Doubled demand (relative to 2018) reflects current efficiency trends continuing alongside predicted growth in compute instances.

*“Data centers are energy-intensive enterprises, estimated to account for around **1% of worldwide electricity use** [and] have clear implications for global energy demand. By 2018, **global data center workloads and compute instances had increased more than sixfold** [compared to 2010]. The **next doubling of global data center compute instances** may occur within the next 3 to 4 years”*

**MANAGED BY:**

-  Cloud provider
-  Telecom operator
-  On-premise

**CLOUD**

**FOG**

**EDGE NETWORK**

**EDGE DEVICES**

10s globally

10s per city

100s per city

1000s per city

Number of elements

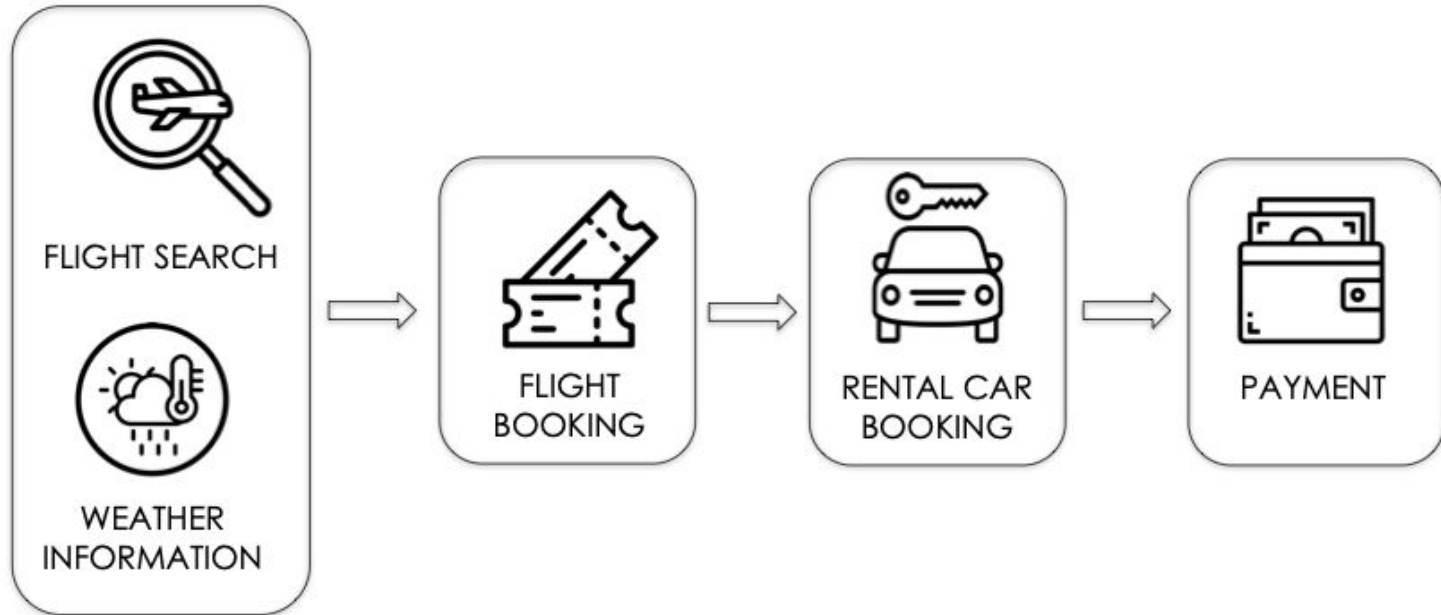

GOAL engage application designers in  
the path towards IT and IS sustainability

**GOAL** engage application designers in the path towards IT and IS sustainability

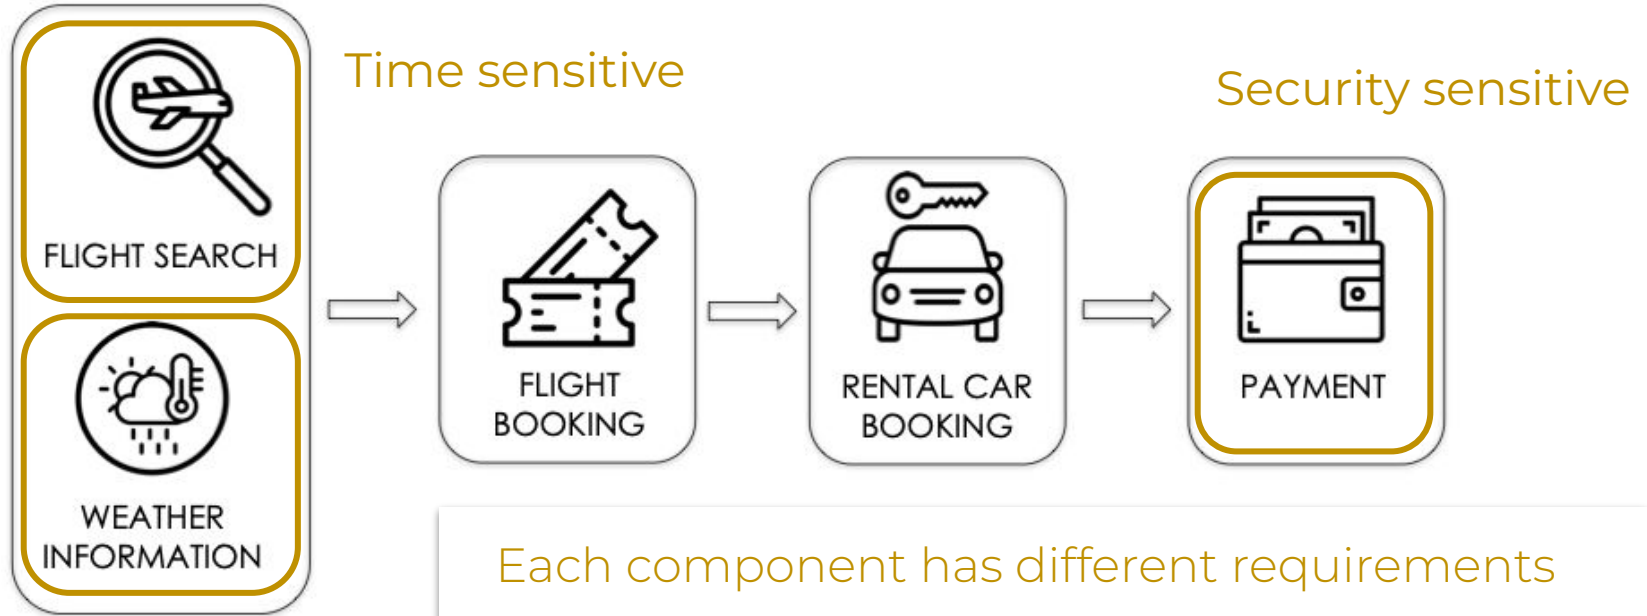

- Increasing sustainability-awareness
- Suggesting best practices
- Providing tools for sustainable-driven (re)design

# CLOUD NATIVE APPLICATIONS

# CLOUD NATIVE APPLICATIONS

Not time sensitive

# CLOUD NATIVE APPLICATIONS

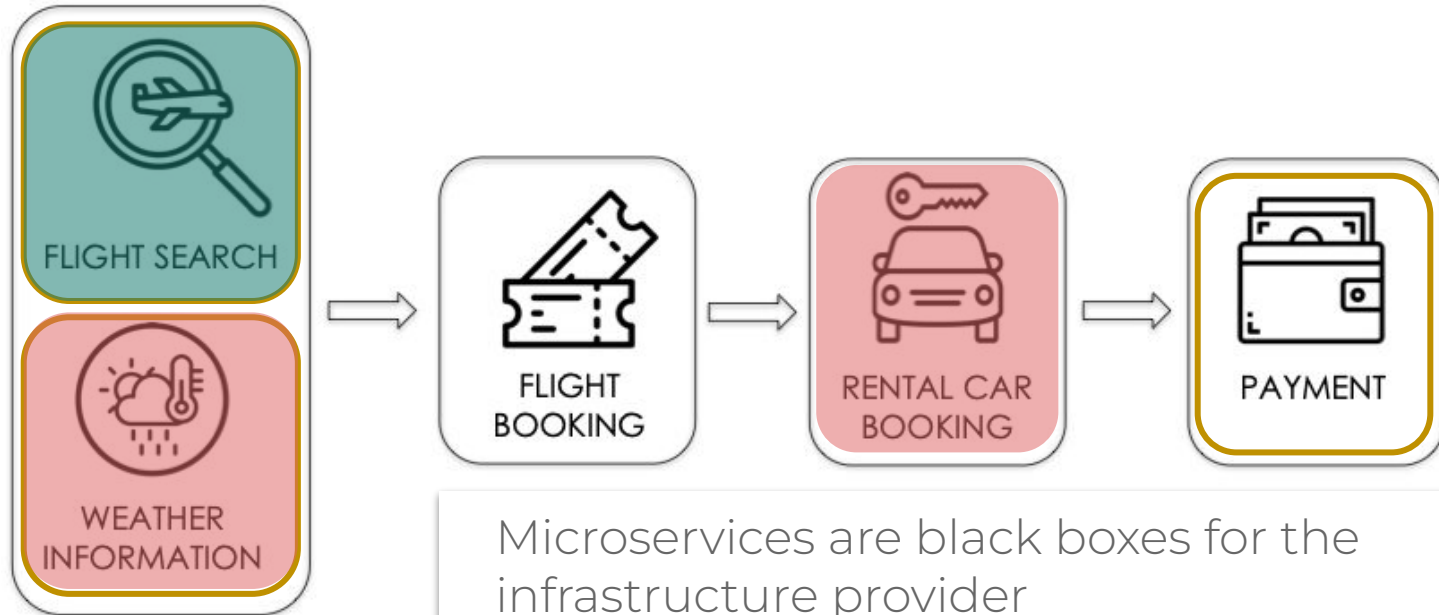

# CLOUD NATIVE APPLICATIONS

Alternative implementations of the same functionality can be provided

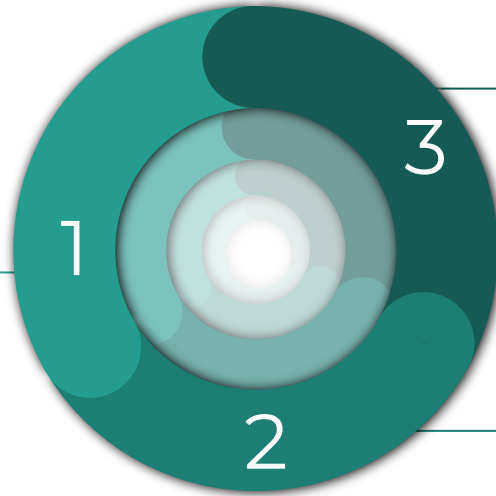

# CLOUD NATIVE APPLICATIONS

Microservices are black boxes for the infrastructure provider  
All these features are hidden and don't adapt with the context of execution

# SADP - Sustainable Application Design Process

**SUSTAINABILITY  
AWARENESS**  
Microservice annotation  
with computational  
requirements, QoS  
constraints, and power  
consumption metadata

**MICROSERVICE  
ENRICHMENT**

Designers provide different  
execution modalities for the  
microservices composing the  
application

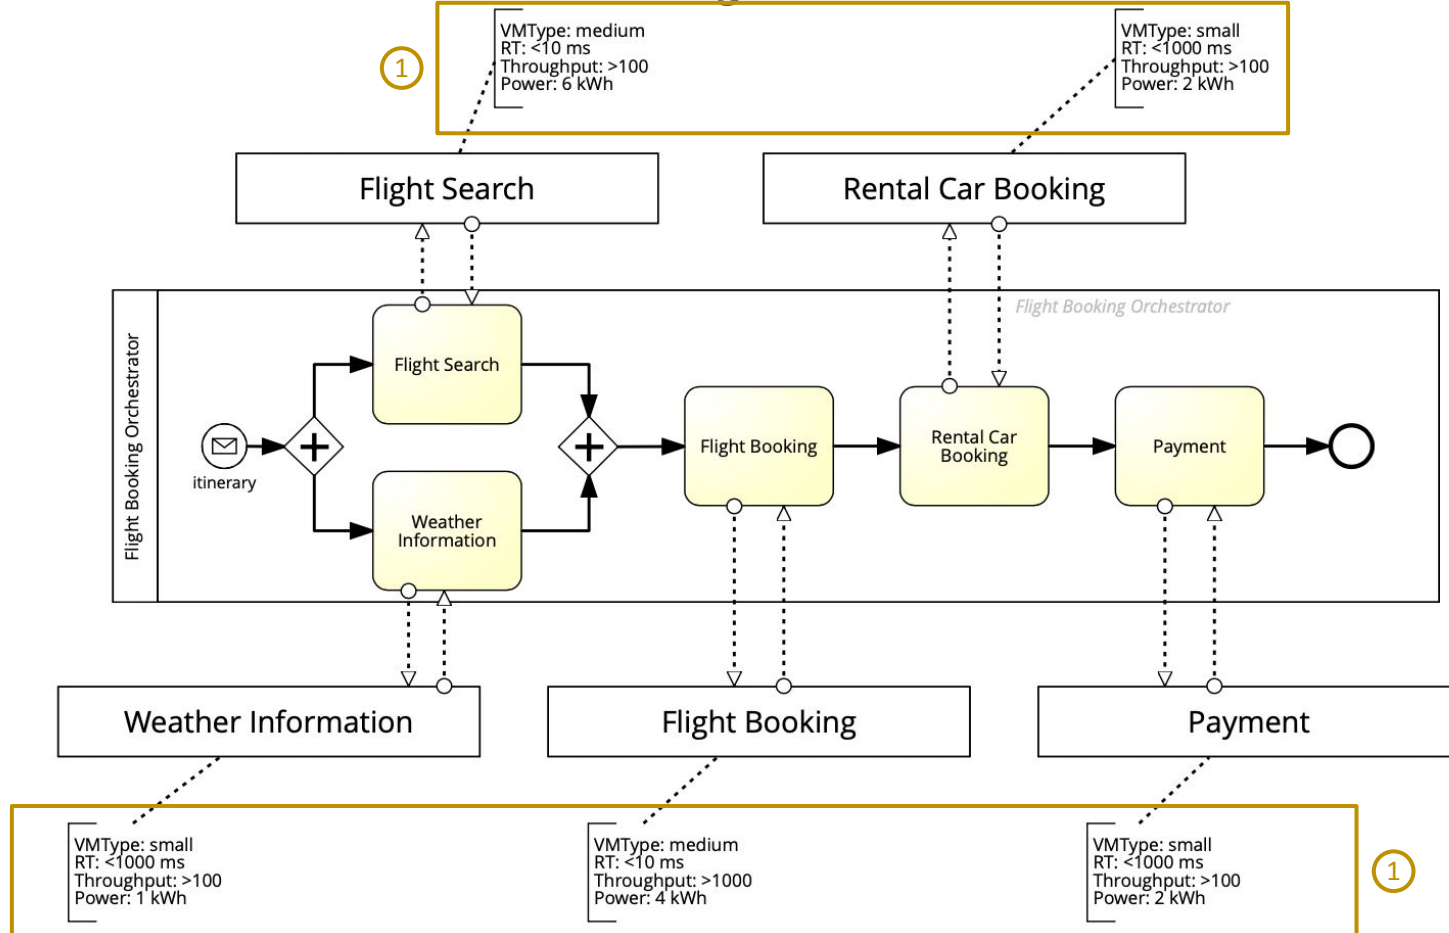

**MICROSERVICE  
CLASSIFICATION**

Application components are  
annotated with their relevance for  
the overall process

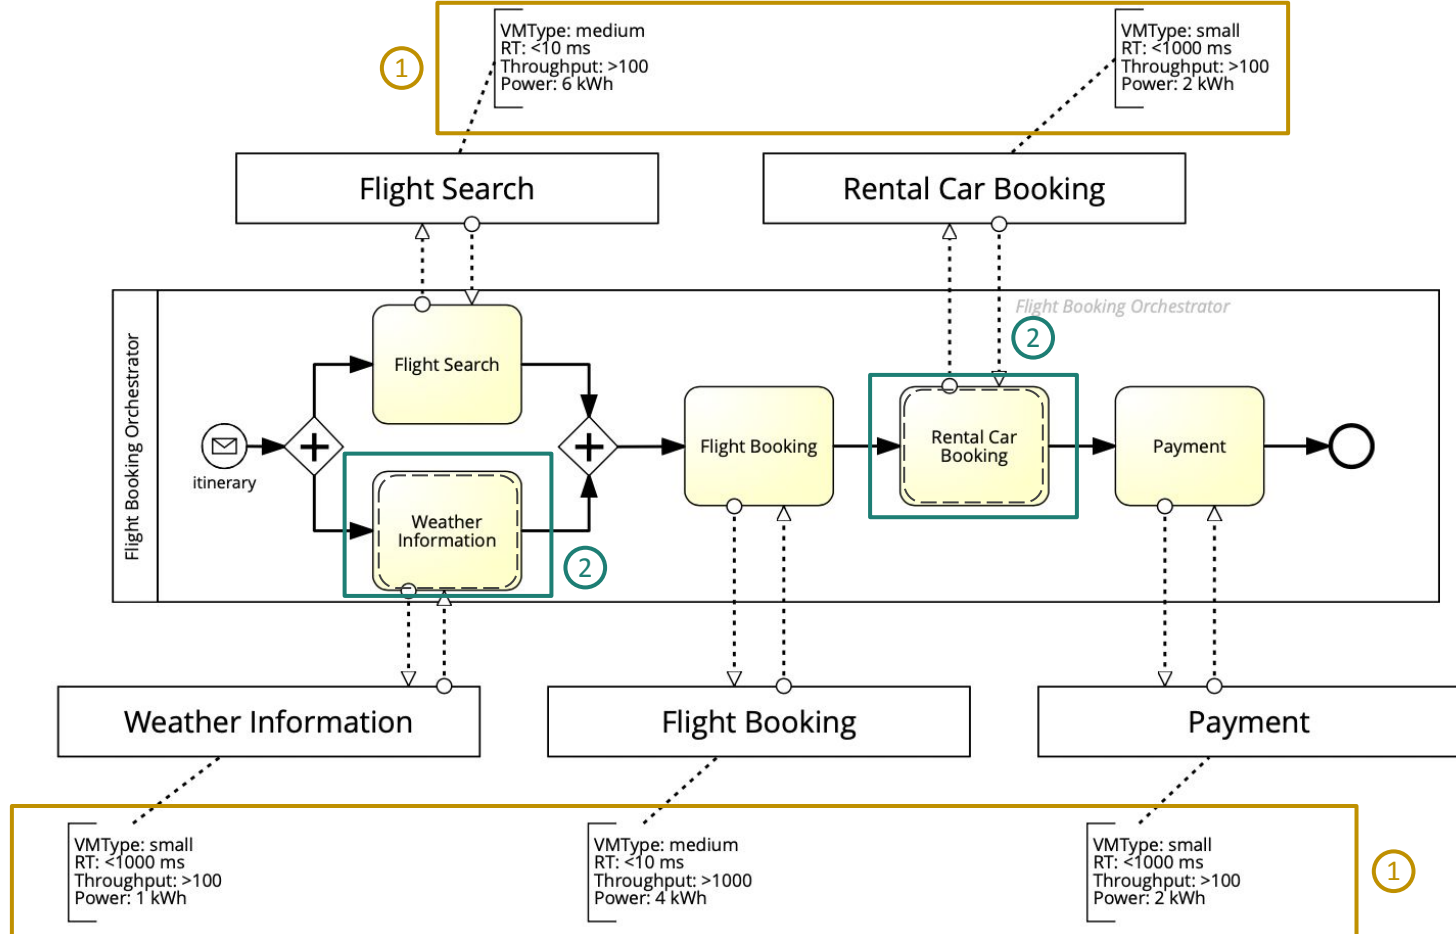

# SADP 1 - Sustainability Awareness

# SADP 1 - Sustainability Awareness

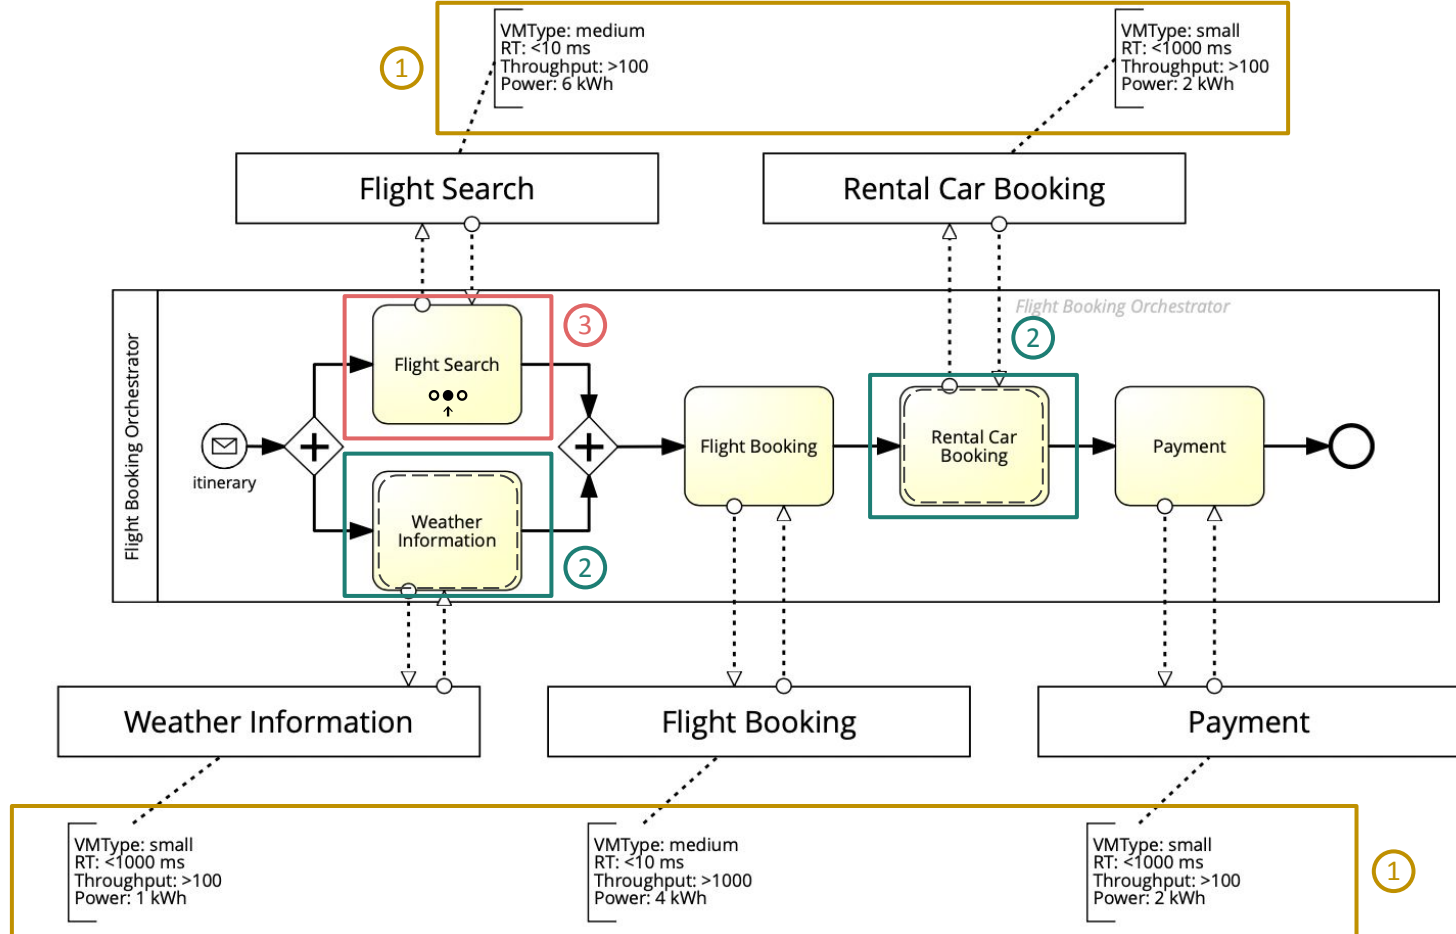

# SADP 2 - Microservice Classification

# SADP 3 - Microservice Enrichment

# SADP - Increasing sustainability awareness

## Flight Booking Service Dashboard

CO2 emissions per component over time

Energy usage per component over time

## SADP Score

Sustainability Awareness

Microservice Classification

Microservice Enrichment

## HINTS

1. Provide alternative implementations for microservice "Flight Booking"
2. Provide alternative implementations for microservice "Payment"
3. ...

# SADP - Sustainable Workflow Design

Exploiting the SADP features at execution time

Different execution modalities:

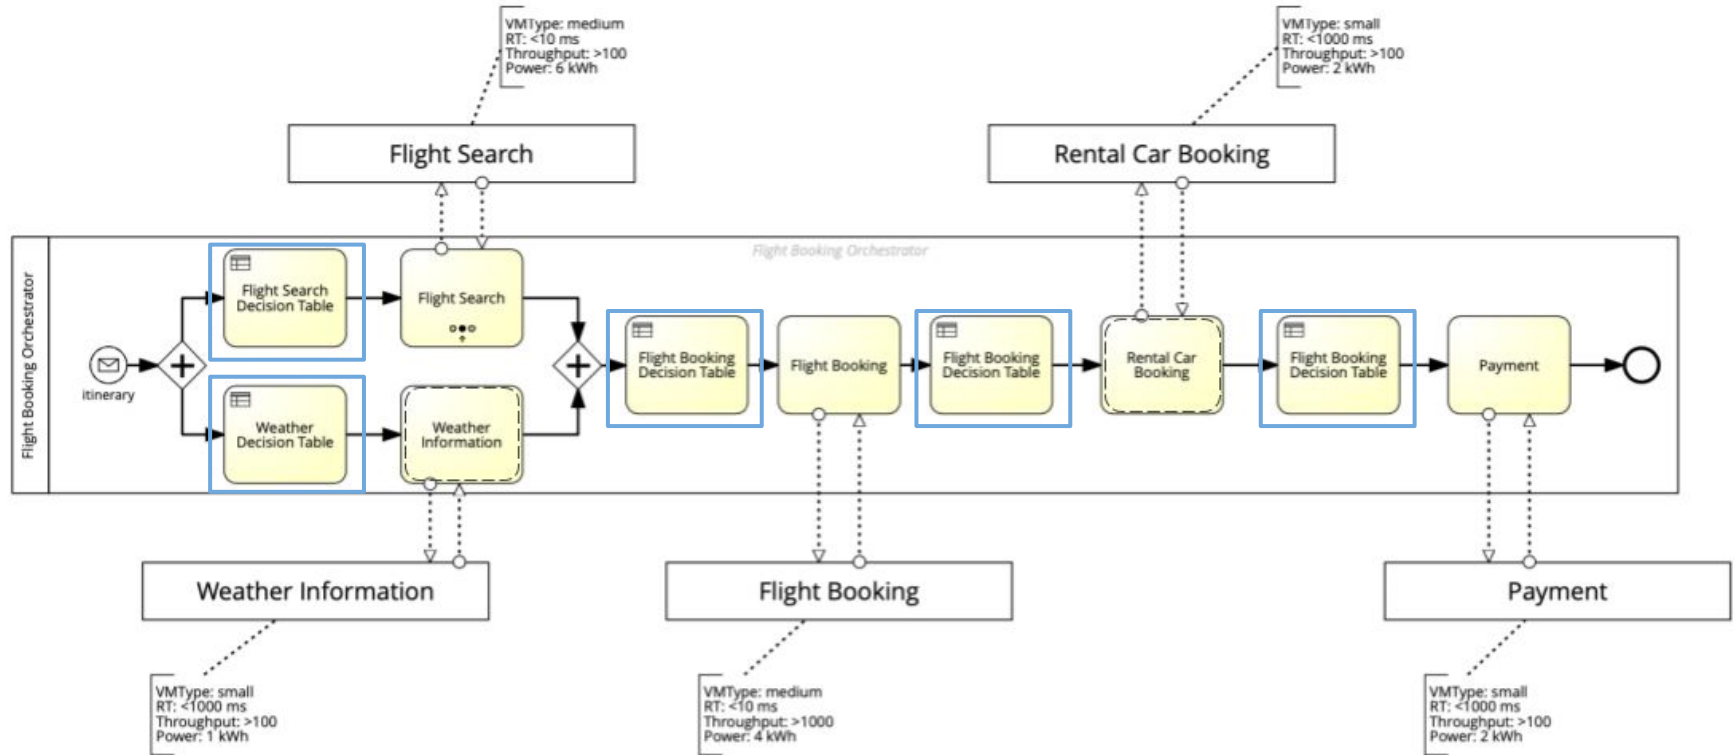

- **NORMAL** - typical execution
- **BASIC** - skips optional components
- **HIGH PERFORMANCE** - executes the performance enhanced version of a component if available
- **LOW POWER** - executes the low power version of a component if available

# SADP - Sustainable Workflow Design

Different execution policies:

- **ALL IN** - same execution modality for all the components
- **OPTIMISED SELECTION** - best combination at the component level

# SADP - Sustainable Workflow Design

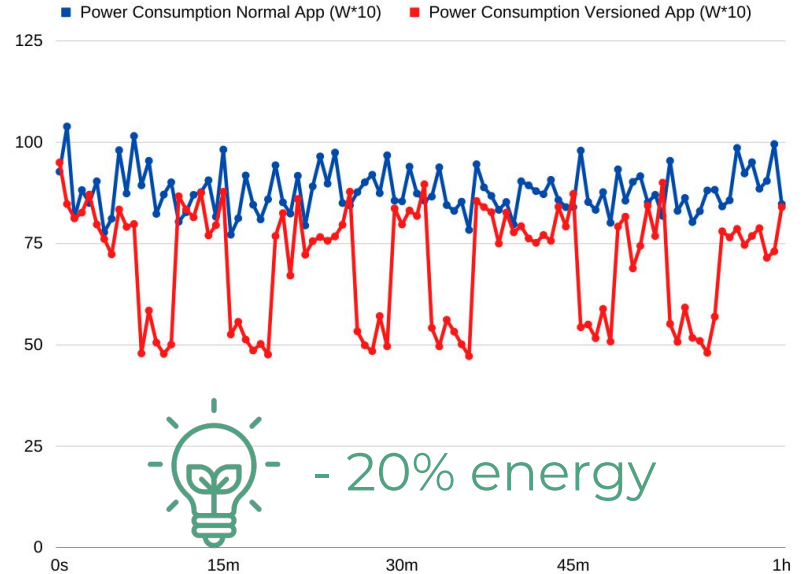

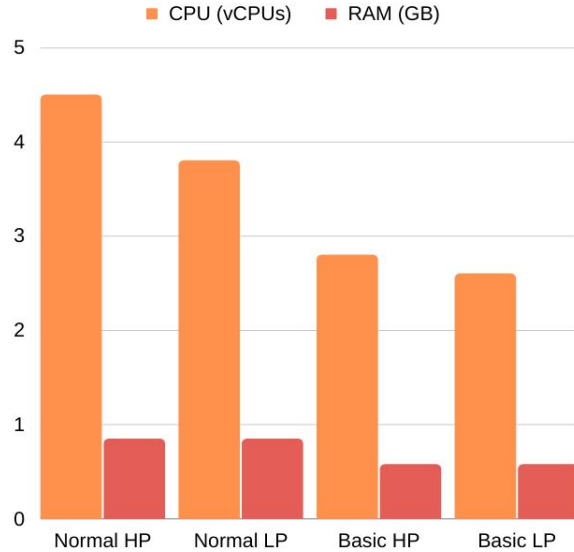

Enriching the process with Business Rules based on DMN

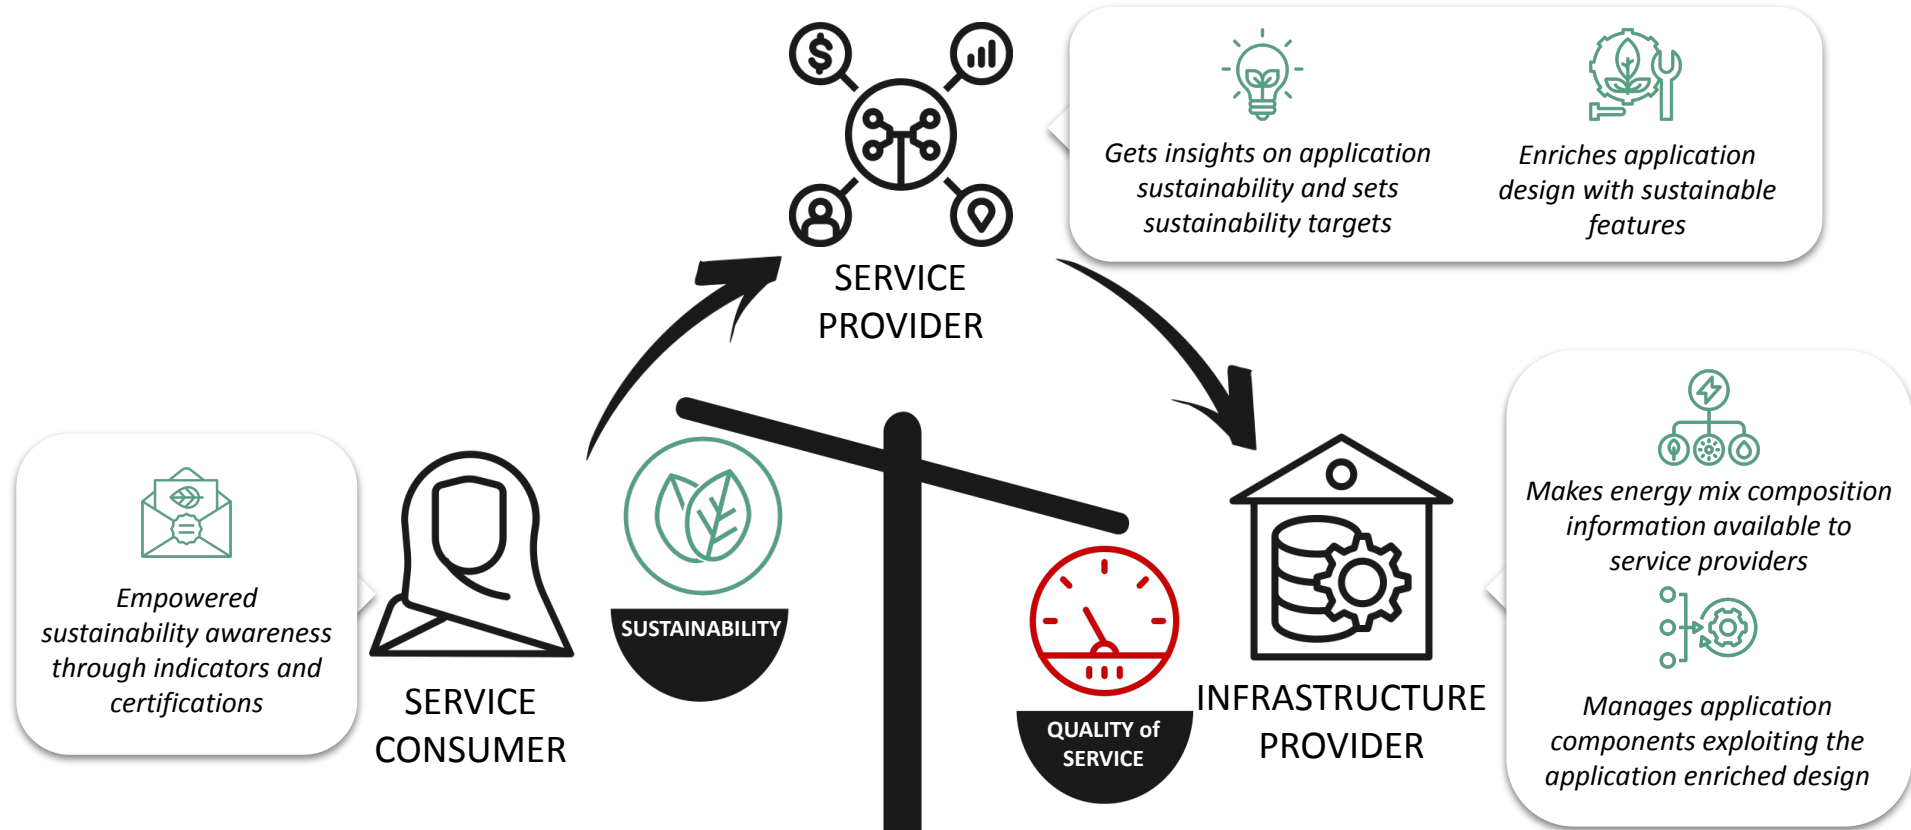

# PRELIMINARY RESULTS

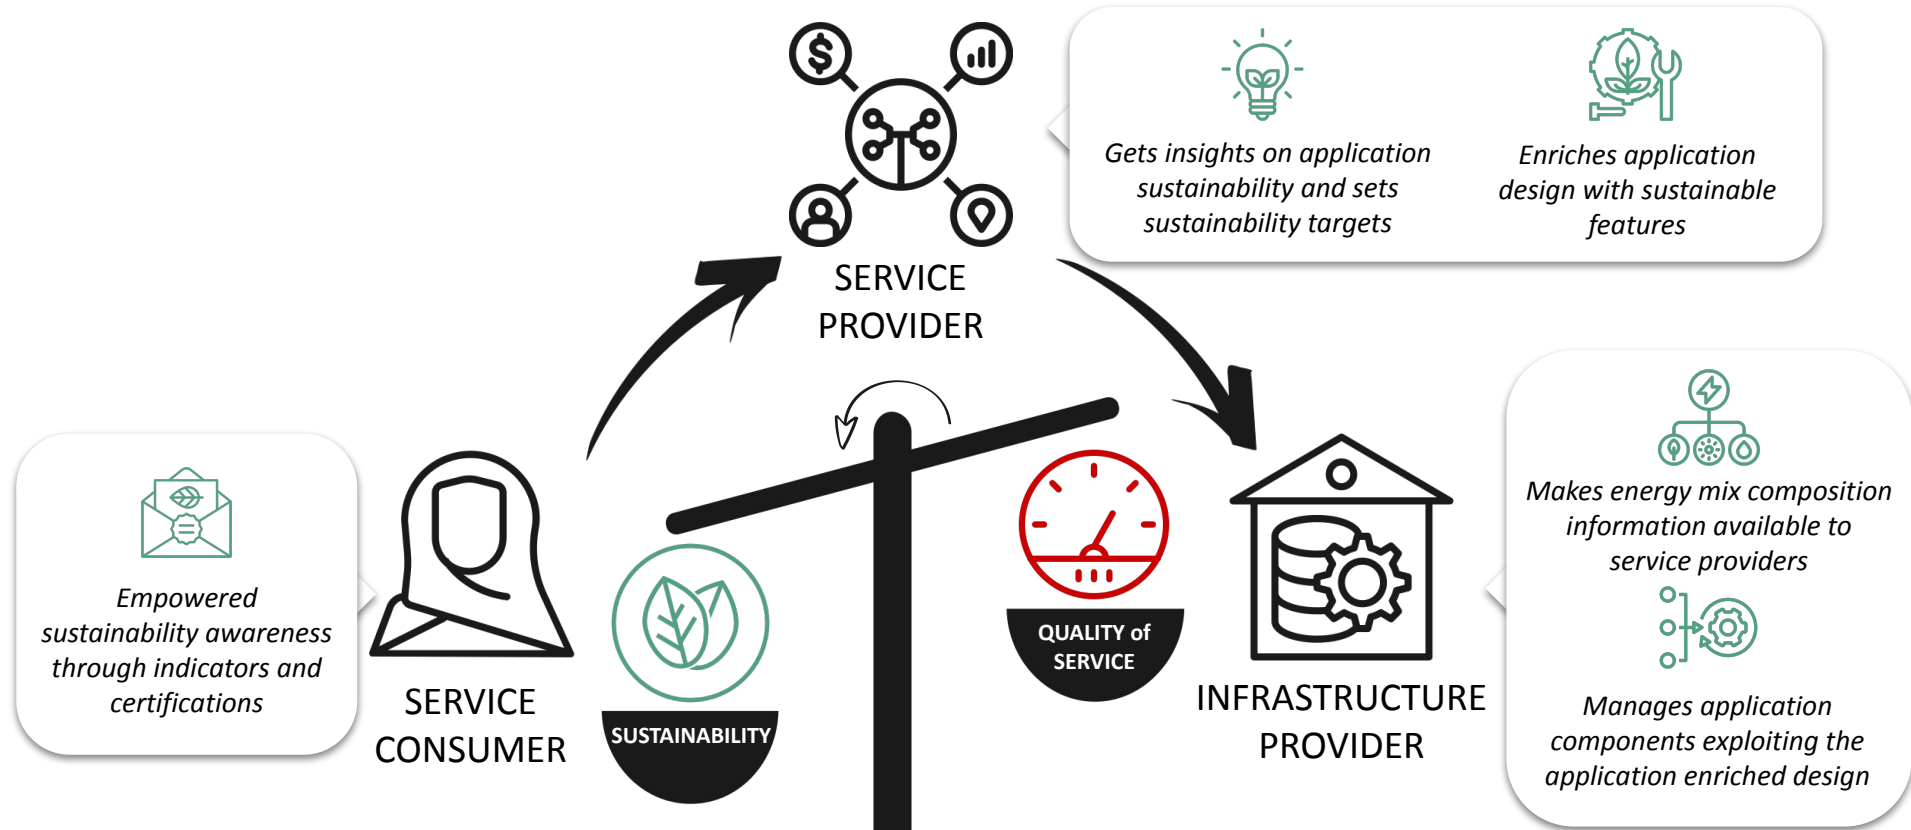

CPU/Memory Utilization 100 Users

# HOW CAN WE CHANGE IT?

# HOW CAN WE CHANGE IT?

# CONCLUSIONS

IS sustainability requires the involvement of all the stakeholders

A sustainability-aware design enables a **greener application management**

Preliminary results shown feasibility and energy reduction

The tradeoff between sustainability and QoE/revenue need to be explored

THANK YOU FOR YOUR ATTENTION
